

SKYNN AI v2.1 — beta · Follow-up release

Basic → Advanced, branded PDFs, Smart Routines, no-inference copy · 28 September 2026 · addendum to the v2.1 Release & Implementation Summary

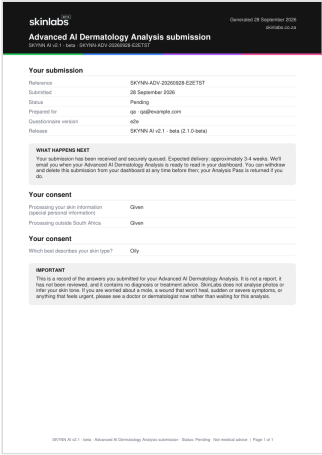

1. What shipped

Request	Result
Legal and public copy matches the no-photo, no-inference product	Privacy Policy (new §4, v1.1), Terms §3, Refund Policy (Analysis Passes), Cookie Policy, Whitepaper, llms.txt, membership email and the SKYNN UI were rewritten. Photos stay on the device and are never uploaded or analysed; MST is self-reported. A guard test fails if the old claims come back. A photo no longer raises the completeness score.
Basic analysis is the starting point of the Advanced analysis	Raw quiz answers are now saved. A new Advanced session is seeded with suggested answers (never consent, safety, quality-of-life or pregnancy), each marked "check it still fits" until changed. The link is recorded on the session and shown as "Started from" in the intake record.
Branded PDF summary for both analyses	Basic: full result, routine and every answer, re-downloadable from the dashboard. Advanced: the member's submission record (status "Pending", every answer as asked, never presented as a report).
Analytics for personalisation	Whitelisted SKYNN events (prefill, PDF, Smart Routine, recommendations). Personalisation reads the member's own submissions, never analytics events.
Smart Routines in the dashboard	My Skin > Routine and a Home card. Rule-based now, from the Basic result, the Advanced answers and SkinLabs-reviewed products only; replaced by the approved report's AM/PM steps once one is released.
Gap scan and fixes	Code review found 10 issues; all were fixed (section 5). Two security-relevant defects were found and fixed earlier in the work (section 5).

2. The two branded PDFs

Basic AI Skin Analysis report (page 1 of 3)

Advanced submission record (status: Pending)

Both were generated by the real download buttons in a production build against a mocked Supabase, rendered to images and inspected. The Advanced sample uses the test questionnaire, not the live 73-question definition.

3. Smart Routine rules

- Inputs: the latest saved Basic result and the latest Advanced answers (Advanced wins where both answer the same thing), plus the profile's allergy list.
- Products come only from SkinLabs-reviewed products; nothing is invented. A step with no match shows a generic product type.
- Avoid list honoured; budget-conscious members get best-value picks; a reviewed product already on the member's shelf is kept.
- Pregnancy, breastfeeding, trying to conceive or **"prefer not to say"**: no retinoid or hydroquinone products (fails safe). Cosmetic wording only; a test scans every string for medical claims.

- Weekly plan keeps exfoliating acids and treatment nights apart; sensitive skin gets fewer treatment nights.
- Saving goes only through `save_smart_routine()`. Rebuilding updates kept steps in place, so check-in history and streaks survive; the member's own steps are never touched.

4. Analytics and personalisation

- New events: `skynn_advanced_prefill_applied`, `skynn_smart_routine_generated / rebuilt / step_checked`, `skynn_recommendation_viewed / clicked`, `smart_routines_accessed / generated`. Payloads are counts and tokens only.
- `analytics_events` INSERT could previously attribute an event to any user id; it now requires a null or the caller's own id.
- Admin > SKYNN Reviews ops panel gained "started from Basic" and "Smart Routines saved" counts.

5. Findings fixed

Finding	Fix
Security: members could UPDATE every column of an unsubmitted Advanced session (default privileges were never narrowed)	Column-limited grant; new probe (7 assertions)
Security: analytics user id spoofable	Insert policy tightened
Rebuilding a Smart Routine erased check-ins and streaks	Update in place; ticked starter steps adopted as the member's own; probe extended (20 assertions)
A routine missing its am/pm list passed validation	NULL-safe validation; report text clamped client-side
"Prefer not to say" on the pregnancy question allowed retinoids	Fails safe
Report-based routine still said retinoids were left out	Note replaced with an accurate one
"Confirmed by the member" wording for prefilled answers was not true; hint stayed after a change; link call could silently fail	Wording corrected, hint clears on change, link retried once
Privacy Policy promised deletion controls that do not exist	Now promises removal on request or with account deletion
Older saved analyses printed a photo completeness factor	Removed on display and in the PDF
Home loaded the full report for every visit; one failed logo fetch cost later PDFs their logo	Home skips the report call; only a loaded logo is cached
Free members could not reach their own saved analyses	Saved analyses and PDFs now available on the free tab

6. Verification (what was actually run)

- TypeScript: clean. Lint: 0 errors (warnings pre-existing). Unit tests: **497 pass, 0 fail**.
- End-to-end (Playwright, production build, mocked Supabase, desktop and mobile × light and dark): **92 passed, 4 skipped** (the skipped ones need a PayFast sandbox merchant).
- Rolled-back SQL probes on the live project: `smart_routines` 20/20, `advanced_session_grants` 7/7, `advanced_pass_gate` 22/22.
- Live end-to-end with a throwaway account: Advanced session started from a Basic row, submitted, reference issued, the worker generated the intake PDF and sent the internal email on the first attempt, then the submission was withdrawn (Analysis Pass refunded) and all test rows deleted.

Not verified: CI. Every GitHub Actions run, including on main, fails because no runner is assigned to the repository (most likely an account billing or spending-limit setting, not code), so the local runs above are the evidence. The wording of the "Started from" row was verified by a unit test; the PDF text itself was not read back from storage.

7. Deployment state

Item	State
Migrations 20260928160000, 170000, 171000, 180000	Applied to the live project
<code>skynn-advanced-assessment</code> v35, <code>email-processor</code> v39, <code>skynn-advanced-worker</code> v26	Deployed pinned to commits on this branch; unauthenticated calls return 401

8. Still needs a human

- **Legal read** of the rewritten Privacy Policy, Terms, Refund Policy, Cookie Policy and Whitepaper.
- **Advanced reports are still not AI-generated.** Production runs in fallback mode (submissions are stored as "Pending"). Before it changes: record the dermatologist sign-off, set a working AI key, switch report_mode.
- **Decision:** a commit on main (32b7ce9) tried to rename the Advanced button to "Get An Advanced AI Dermatology Report" while breaking AIFormulator.tsx (the file was replaced by a placeholder line). This branch keeps the working file and the standard name, because "Report" contradicts the agreed terminology while submissions are pending. Say if you want the rename; it needs the terminology file, guard test and e2e changed together.
- Fix the CI runner setting so the checks run automatically; add the SUPABASE_DB_URL secret for the SQL probes.
- Members cannot yet delete a saved Basic analysis or Smart Routine themselves (the policy says so honestly). A delete control would be a sensible next step.
